ISMS Scope Document

TechNova Solutions

Version: 1.0

Date: 28 March 2026

Prepared by: Wissal Lazraq

1. Purpose:

The purpose of this document is to define the scope of the Information Security Management System (ISMS) for **TechNova Solutions**.

This scope establishes the organizational, physical, and technological boundaries of the ISMS and identifies the information assets, systems, people, and processes that are subject to information security governance, risk management, and control implementation.

The ISMS is designed to support the protection of the **confidentiality, integrity, and availability** of information processed by TechNova Solutions, with particular focus on customer data and business-critical systems.

2. Organization Overview:

TechNova Solutions is a fictional Software-as-a-Service (SaaS) startup that provides a cloud-hosted web application to its customers. The company operates with a small team of approximately **10 to 20 employees** and relies on a lean technical environment to deliver its services.

The organization stores and processes customer information through:

- a **web application**,
- **backend application services**,
- a **production database**,
- **cloud-hosted infrastructure**,
- and employee-managed access to internal administrative resources.

As a SaaS provider, TechNova Solutions depends on the availability, reliability, and security of its information systems to maintain customer trust and business continuity.

3. ISMS Objective:

The objective of the ISMS is to ensure that TechNova Solutions:

- protects customer and business information against unauthorized access, disclosure, alteration, and destruction,
- identifies and manages information security risks in a structured manner,
- establishes appropriate security controls for a startup environment,
- supports operational resilience and incident preparedness,
- and demonstrates a basic but credible alignment with recognized frameworks such as **ISO/IEC 27001** and **NIST** good practices.

4. Scope Statement:

The ISMS of TechNova Solutions applies to the people, processes, and technology involved in the delivery, administration, support, and protection of the company's SaaS platform.

In scope:

The ISMS includes the following assets, services, and activities:

Business Processes

- Operation and support of the SaaS platform
- Management of customer data handled by the platform
- User account administration
- Security monitoring and incident handling
- Backup and recovery activities
- Internal access to company systems and administrative environments

Technology and Information Assets

- Customer-facing **web application**
- **Backend application services** and APIs
- **Production database** storing customer data
- **Cloud infrastructure** hosting application components
- Administrative consoles and privileged access accounts
- Logging and monitoring solutions
- Backup storage and recovery-related resources
- Company-issued employee laptops used to access production or business systems
- Internal documentation related to security, risk, and operations

Personnel in Scope

- Engineering personnel
- Operations / infrastructure personnel
- Management personnel with decision-making or privileged access responsibilities
- Customer support personnel with authorized access to customer-related data or systems
- Any employee or contractor granted access to in-scope systems

5. Organizational Boundaries:

The ISMS covers the internal functions of TechNova Solutions that interact with or influence the security of the SaaS platform and its supporting environment.

Included organizational functions

- Engineering / software development
- Operations / infrastructure administration
- Management oversight
- Customer support with authorized system access
- Administrative users with privileged access

Not included

The following elements are outside the current ISMS scope unless explicitly connected to in-scope assets or services:

- third-party systems not controlled by TechNova,
- customer-managed devices or environments,
- external services that do not process or store TechNova information in a material way,
- personal systems or unmanaged devices not approved for company use.

6. Technical Boundaries:

The technical scope of the ISMS includes the primary information systems and supporting components required for service delivery and data protection.

Included technical components

- Web application frontend
- Application backend / API layer
- Production database
- Cloud hosting environment
- Identity and access administration for in-scope systems
- Logging and monitoring mechanisms
- Backup and recovery storage
- Employee endpoints authorized to access company systems
- Security and operational documentation repositories relevant to the in-scope environment

Security-relevant interactions

The ISMS also considers data flows between:

- customers and the web application,
- the web application and backend services,
- backend services and the production database,
- administrators and cloud or application management interfaces,
- internal personnel and company-managed endpoints.

7. Information Assets Covered

The ISMS applies to information assets processed, transmitted, or stored within the defined scope, including:

- Customer account information
- Customer business data stored in the application database
- Authentication-related data
- Administrative credentials and privileged access information
- System logs and monitoring records
- Configuration data
- Backup data
- Internal operational and security documentation

Information classification assumption

For this mini compliance program, the following high-level classification model is used:

- Public
- Internal
- Confidential
- Restricted

Customer data, administrative credentials, and production database contents are considered Confidential or Restricted, depending on sensitivity and business impact.

8. Physical and Operational Context

TechNova Solutions operates as a small startup with a limited internal structure and a practical, cloud-first operating model. Employees may work from office or remote environments and access company systems through approved devices and accounts.

Because the company has a small team and no large dedicated compliance department, the ISMS is intentionally designed to be:

- lightweight,
- realistic,
- risk-based,
- and appropriate for an early-stage SaaS organization.

9. Exclusions from Scope

The following are explicitly excluded from the current ISMS scope:

- Third-party payroll and HR platforms not directly integrated with production systems
- Personal employee accounts unrelated to company operations
- Customer-owned infrastructure and environments
- Third-party applications used by customers outside the TechNova platform
- Unmanaged personal devices not formally approved for business access
- Non-production experiments or lab environments that do not process real company or customer data

These exclusions are defined to keep the ISMS focused on the core service environment and the assets that present the most significant risk to TechNova Solutions.

10. Interested Parties

The following interested parties are relevant to the ISMS:

- Customers
- Company management
- Employees and contractors
- Business partners and service providers
- Auditors or assessors
- Regulatory or contractual stakeholders, where applicable

Their expectations may include:

- protection of customer data,
- availability of the platform,
- secure administration of systems,
- timely response to security incidents,
- and evidence of basic governance and control.

11. Roles and Responsibilities

Management

Management is responsible for supporting the ISMS, approving security direction, assigning responsibilities, and ensuring that identified risks are addressed appropriately.

Junior GRC Analyst

The Junior GRC Analyst is responsible for:

- documenting the ISMS scope,
- supporting risk assessment activities,
- maintaining compliance-related documentation,
- assisting in control mapping,
- and preparing audit and governance materials.

System / Technical Owners

Technical owners are responsible for implementing, maintaining, and evidencing relevant controls within their systems and processes.

Employees and Contractors

All personnel with access to in-scope systems are responsible for following approved security policies and protecting company and customer information.

12. Key Assumptions

The following assumptions apply to this mini compliance program:

- TechNova Solutions uses a cloud-hosted architecture for its SaaS platform.
- The company stores customer data in a production database.
- Access to production resources is limited to authorized personnel.
- Basic logging and backup capabilities exist, though they may not yet be fully mature.
- Security governance is in an early stage and requires formal documentation and structured processes.
- The organization seeks a practical foundational compliance program rather than a fully certified ISMS.

13. Constraints

The current ISMS is developed under the following constraints:

- limited staff size,
- limited security specialization,
- startup operational maturity,
- and practical budget/resource limitations.

Accordingly, the ISMS prioritizes the most critical risks affecting:

- customer data,
- privileged access,
- service continuity,

- and security event response.

14. Scope Review and Maintenance

This ISMS scope shall be reviewed:

- annually,
- upon major changes to the business model or technical environment,
- or when new systems, processes, or data types significantly affect the security posture of TechNova Solutions.

Any material change in architecture, customer data handling, hosting arrangements, or access models should trigger a reassessment of the scope.

15. Approval

This scope document is considered approved for the purpose of the TechNova Solutions mini compliance program and serves as the baseline for:

- asset identification,
- risk assessment,
- risk treatment planning,
- policy development,
- control mapping,
- and internal audit preparation.
